

Dear customer,

V1.4.1 fw update can be performed locally using a FAT32 “bootable” USB pen,

Or remotely via browser on Ossia recorder running fw v1.3.x or higher – all settings will be kept.

The recorder will reboot few times during the update process, do not interrupt the process till getting the split display screen on the local monitor – locally.

If performing update remotely, you can try refresh the browser after ~10 minutes.

You might need to clear the browser cash memory for getting the login screen correctly.

Best Regards,

Provision-ISR Technical team
